

8 Reasons Why Accelaflow is the Right Choice

Companies are exploding at the seams with paperwork and electronic communications. Many process thousands of applications, forms and documents on a daily basis, but the flow of that information is not fast or efficient enough. We have innovative software solutions to solve this massive problem.

Since 1996, we have been the proven technology provider for companies looking for various workflow solutions. We manage your documentation, communications (via fax, mail, email, online, scan) and statuses for the entire life cycle of the loan or process.

We are proven, reliable, and very innovative!

#1 SOA Architecture makes it easy to implement and support

If you can use a browser, you'll feel right at home with Accelaflow. Accelaflow requires no plug-ins, desktop software or Active X controls. It is a browser-based solution that uses the latest technology to provide a user interface that can be accessed anywhere, by anyone with the right permissions.

Since Accelaflow is a browser-based platform with no user limitations all software resides on one or more servers. Implementing new workstations requires only a login and a password supplied by your system administrator.

#2 Designed to process all items from all sources

Accelaflow maximizes operational performance and reduces cost by providing one solution to manage, distribute and deliver all work. Accelaflow processes mail, faxes, documents, payments, emails, tasks, on-line forms, system requests and much more. Regardless of the number of sources and endpoints, Accelaflow manages and tracks all your work items.

#3 Dashboard includes configurable thresholds to monitor items & tasks

Accelaflow displays information about work types on several levels. At the highest level, users can see work by department or role. At the lowest level, users are able to view job and item detail with the simple click of a mouse button. Accelaflow makes it easy to determine where bottlenecks are and where to allocate critical resources.

#4 Connects all workflows and business processes

By allowing workflows to connect and share processes, items completed in one workflow can continue down the path of another. Newer systems can be connected to older systems with Accelaflow providing the backbone. Accelaflow recognizes that connecting workflows and enabling management to view step history, user actions and results is a requirement for enterprise business process management.

#5 Utilizes built-in adapters that allow it to leverage existing systems

Accelaflow integrates with databases, homegrown applications and content management solutions so users can continue to work in other systems but still gain the benefit of workflow management. Accelaflow can receive items from multiple sources, connect to different systems in-line during processing, and update multiple endpoints.

- ☒ Mainframe Host

#6 Includes configurable metrics, search and reporting capabilities.

Accelaflow allows departments to configure their own metrics and extract throughput and productivity data in real time. Accelaflow metrics dashboard enables users to measure specific processes or data across multiple workflows. Information can be viewed through graphs, tables and meters or extracted to a separate management report for further review.

#7 The process modeler uses re-usable processes for easier integration.

Every workflow is a combination of business processes connected together. Many times these processes require interfaces to internal applications to retrieve and update information. Accelaflow reduces the time required for development and testing by allowing processes to be copied to other workflows. By incorporating processes as reusable assets, Accelaflow workflows are easier to model and faster to implement.

#8 Tracks all step history for the entire item lifecycle.

Accelaflow provides detailed step history for all work items. Even if a work item travels through several workflows and is modified by multiple users, Accelaflow will track the entire process. Step history shows actions and results; in addition to user, date and time stamps.
